What is Dancer?

Dancer is a simple but powerful web application framework for Perl.

Key features

- **Dead Simple** - Intuitive, minimalist and very expressive syntax.
- **Flexible** - PSGI support, plugins and modular design allow for strong scalability.
- **Few dependencies** - Dancer depends on as few CPAN modules as possible making it easy to install.

Easy database interaction

If you're using a Perl web framework, you want the easy stuff taken care of for you, so you can write the interesting stuff. The same applies to database access - it should be simple and non-tedious.

ORM with DBIx::Class

Dancer::Plugin::DBIC provides easy database access using DBIx::Class:

```
get '/profile/:id' => sub {  
    my $user = schema->resultset('Users')->find(params->{id});  
    ....  
};
```

Or easy DBI database access

Dancer::Plugin::Database manages your database connections, providing an augmented DBI database handle for you to use:

```
get '/profile/:id' => sub {  
  my $user = database->quick_select('Users', { id => $params->{id} });  
  ...  
};
```

Either way, we've got you covered.

What people say about Dancer...

I just spent yesterday with Perl Dancer and was able to get a website going for my Dad's software consulting company in no time at all! Thanks for all your efforts on Dancer it is pretty awesome. - Bryon Wickland
